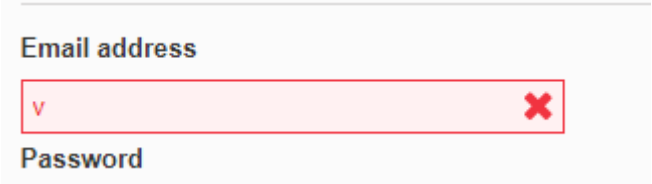
Assumptions& difficulties

* Difficulties :

- Task1

In this part, I found the problem to get the error in the field Email Address.

When input an fail email ,the field is highlight, but not always is displayed with the same frequency.



I did the step : `#And the field should display in <color>`

And the page Object as well but is comment due is not working properly yet.

-Task2

In this part, I found the problem to reach the Add button when doing the mouseover, so the workaround is enter directly in the product selected and click in the other Add to cart in the next page.

I could improve this part checking the add button (first) as well.

- Improvements

-As I said before, including one scenario checking the Add button when using the mouseover in the product selected.

- Fix the code when try to catch the error in the field of email address

-Include other scenario to check the input manually when change the quantity (actually only checks using plus icon (+))

-Add one step to check how the totals or price change in the order when makes modifications.

-Also to refactor the steps
```
'it should appear authentication page {string}
it should appear Forgot password page {string}
it should appear Order page {string}
```

all this steps contain the same code and I could use other variable (string) to select authentification,Fogot password page and Order page.
